
Mann–Whitney p = 0.031 two-sided (0.015 one-sided, as reported in §16). With the eight failed top-ranked compounds imputed at the worst observed affinity the difference falls to +0.067 kcal/mol, p = 0.284. Enrichment below −9 kcal/mol is 21.7% vs 15.0%, Fisher p = 0.264 two-sided — not significant.
